# Practical Assignment

Create a single-page responsive E-Commerce application with your choice of language, framework and library. Please find below some ideas/ approaches/ways how we would have done it and what we actively look for:

- On the front-end side, there would be an implementation of state management
- Users could browse articles, add to a cart and submit a cart
- Articles would have basic information, like name, description, price, etc.

And of course, it is always a good idea to test the code (coverage is not evaluated). Any kind of back-end implementation would be highly appreciated.

We focus on containerizing our applications. If you have this superpower and have some time left, feel free to show it off. Please provide concrete steps to run the submitted homework. We highly encourage you to time-box the assignment.
